Primary care physicians (PCP) workforce shortages challenge the long term viability of U.S. primary care, a foundation of the Triple Aim for U.S. health care. The Triple Aim envisions primary care as an integrating component working across its three goals of improving the quality of care, improving health of populations, and reducing per capita health care costs.¹ Studies of the future need for primary care providers indicate that demographic and policy trends will only strain a workforce already struggling to meet national needs.² Other analyses document geographic maldistribution of PCPs, within states as well as across states.³ Addressing both physician shortages and maldistribution requires analysis and action on the state level.

**Methods.** The Robert Graham Center projected the Kansas PCP workforce necessary to maintain current primary care utilization rates, accounting for increased demand due to aging, population growth, and an increasingly insured population due to the Affordable Care Act (ACA). Primary care use was estimated with 2010 Medical Expenditure Panel Survey (MEPS) data. Current active PCPs within Kansas were identified using the 2010 American Medical Association (AMA) Masterfile, adjusting for retirees and physicians with a primary care specialty but not practicing in primary care settings. Kansas population projections are from the Census Bureau’s 2005 projections based on the 2000 Census.⁴

To maintain current rates of utilization, Kansas will need an additional 247 primary care physicians by 2030, a 13% increase compared to the state’s current (as of 2010) 1,797 PCP workforce.

---

⁴ For full description of the methodology, see http://www.graham-center.org/tools-resources/state-projections.htm.
Implications for Kansas

To maintain the status quo, Kansas will require an additional 247 primary care physicians by 2030, a 13% increase of the state’s current (as of 2010) 1,797 practicing PCPs. The current population to PCP ratio of 1561:1 is greater than the national average of 1463:1. The 2030 projection stands below the Midwest overall and below the nation overall. Components of Kansas’s increased need for PCPs include 46% (116 PCPs) from increased utilization due to aging, 34% (86 PCPs) due to population growth, and 18% (45 PCPs) due to a greater insured population following the Affordable Care Act (ACA).

Pressures from a growing, aging, increasingly insured population call on Kansas to address current and growing demand for PCPs to adequately meet health care needs. Policymakers in Kansas should consider strategies to bolster the primary care pipeline including reimbursement reform, dedicated funding for primary care Graduate Medical Education (GME), increased funding for primary care training and medical school debt relief.

### Highlights: Kansas’s Projected Primary Care Physician Demand

### Potential Solutions – Bolster the Primary Care Pipeline

- Physician reimbursement reform
- Dedicated funding for primary care Graduate Medical Education (GME)
- Increased funding for primary care training (Title VII, Section 747)
- Medical school student debt relief
